

Project Report

Local Labour Booking App & Website

Prepared for family discussion & project planning

1. What is this project?

Many people in our area need workers like electricians, plumbers, carpenters, painters, masons, AC technicians, etc. for small home jobs. Right now, people find them through word-of-mouth, local shops, or by asking neighbours — there's no easy, organized way to find a reliable worker quickly.

At the same time, these workers (labourers) don't have an easy way to advertise themselves. They depend on local contacts and luck to get work.

Our idea: Build an app and website where workers can register themselves, and customers can search, view profiles, and send a booking request — all in one place, focused only on our local area.

Think of it like a mini version of "JustDial" or "Urban Company," but focused only on our local area and made specifically for labour/home-service workers.

Figure 1: How the app connects customers and workers

2. Why this is a good idea

- **For customers:** Saves time. No need to ask around or search — just open the app, pick a category, and find someone nearby.
- **For workers:** They get more work opportunities without spending money on advertising. Their phone can start ringing with job requests.
- **For us (the business):** Once many people are using it, there are several ways to earn money (explained in Section 6).

3. What will be in the FIRST version (Release 1)

We won't build everything at once. We'll start with the essential features only, test it in our area, and then add more later.

For Customers (people looking for workers)

- See a list of worker categories (electrician, plumber, carpenter, etc.)
- Search workers by category and area
- View worker's profile — name, photo, experience, phone number, area they cover
- Send a request to book the worker for a job
- Give a rating/review after the work is done

For Workers (labourers)

- Register themselves easily — name, phone number (verified with OTP), type of work, years of experience, photo, and the area they work in
- Get notified when someone sends them a booking request
- Accept or reject the request
- See their own ratings from past customers

For Us (Admin/Owner)

- Approve new worker registrations before they go live (basic check, so fake profiles don't get in)
- See all workers and customers in one place
- Handle any complaints or issues

Figure 2: Step-by-step flow of the booking process

Why we're starting simple: It's better to launch a basic, working version quickly, get real workers and customers using it, and then improve it based on what they actually need — rather than spending months building extra features nobody asked for.

4. What do we need to build this?

In simple terms, building this needs three things:

1. **A "backend"** — this is like the engine or brain of the app. It stores all the data (worker details, customer details, bookings) and makes everything work behind the scenes.
2. **A website** — so people can also use it from a computer or mobile browser, not just an app.
3. **A mobile app** — for Android and iPhone, since most people will prefer using an app.

We also need a few outside services:

- **OTP/SMS service** — to verify phone numbers when someone registers (so fake numbers don't get added)
- **Hosting** — this means renting space on the internet (like renting a shop) where our website and app data will live and run
- **App Store listing** — to publish the app on Google Play Store (Android) and Apple App Store (iPhone)

Figure 3: The building blocks needed for the project

5. Costs — What will it cost us in the beginning?

This is a rough estimate for the starting phase (first few months, small scale — say a few hundred to a couple thousand users):

Item	What it's for	Estimated Cost
Hosting (server)	Keeps the website/app running online	₹500 – ₹2,000/month
OTP/SMS service	Verifying phone numbers	₹0.15 – ₹0.25 per SMS
Domain name	Website address (e.g., www.ourapp.com)	₹800 – ₹1,500/year
Google Play Store listing	One-time fee to publish Android app	₹2,000 (one-time)
Apple App Store listing	To publish iPhone app	₹8,000/year
Basic design/testing tools	Free or low-cost tools during initial phase	₹0 – ₹1,000/month

Rough total to get started: Approximately ₹15,000 – ₹25,000 as a one-time + first month setup cost, and then roughly ₹1,500 – ₹4,000 per month ongoing (this will increase only as more people start using the app, which is a good problem to have).

Note: If we hire developers to build this instead of doing it ourselves, that would be a separate, larger cost — this table only covers running costs after the app is built.

6. How will we make money later? (Future Revenue Plan)

Once we have a good number of workers and customers using the app regularly, we can introduce ways to earn:

- **Small commission** on each booking (like a small percentage fee)
 - **Monthly subscription for workers** — e.g., verified/featured workers pay a small monthly fee to appear on top of search results
 - **Advertisements** — local shops (hardware stores, paint shops, etc.) could pay to advertise on the app
 - **Premium customers plan** — priority booking or verified worker guarantee for a small fee
- We won't charge anyone in the beginning. First priority is to get enough people using the app so it becomes useful and trusted.

7. What else do we need to plan for?

- **Getting the first workers on board:** In the beginning, nobody will register on their own unless there are already some workers on the app. So we'll need to personally go and register 20-30 trusted local workers ourselves to start with.
- **Building trust:** People will only book someone if they trust the app. So checking worker details (ID proof, phone verification) before approving them is important.
- **Marketing/spreading the word:** Posters, word-of-mouth, local social media groups (WhatsApp groups, Facebook community groups) to tell people the app exists.
- **Customer support:** Someone needs to be available to handle complaints, disputes, or technical issues in the beginning.
- **Slow and steady growth:** Start with one area/city, make sure it works well, then expand to more areas.

8. Summary

What are we building?	An app + website to connect local workers (electrician, plumber, etc.) with people who need them
What's the first version?	Worker registration, search, and booking request system
What do we need?	A backend system, website, mobile app, OTP service, and hosting
How much will it cost to start?	Roughly ₹15,000–25,000 to begin, then ₹1,500–4,000/month ongoing (increases as we grow)
How will we earn money?	Later, through small commissions, worker subscriptions, or ads — not from day one
What's the biggest early challenge?	Getting the first batch of workers and customers to start using it

This report is a starting plan and can be adjusted as we learn more during actual development and testing.
